- 4. All medical establishmenus uni medical facilities in the USSR are completely insufficient for the needs of the country. They are also very poorly equipped muterially in all respects. Equipment and servicing of hospitals, especially in the provinces, are very often extremely poor and out-of-date. Dentist's equipment, for in tance, has fallen far behind the US, and even Jermany, by many years. Dentists have very few kinds of materials normally considered a minimal necessity in the US, and their tools are extremely poor and obsolete. Even in Moscow I have seen in entist's offices only the most primitive types of dentist's wrill (the pedestal type), the greater part of which are foot-driven. There is a shortage of most drugs, dressing materials and medicinals and medical implements, and there is an almost complete absence of many of them in common use elsewhere. Penicillin an! sulphidine are in this latter category. Dispensaries are overloaded, and patients have to wait their turns an over-long time, even in Moscow. In the province dispensaries $k_{\rm H}$ own to me, in spite of the fact that they operate in two shifts similar to Moscow dispensaries, overcrowding is the normal thing. A patient must first wait to receive an appointment at the registration office of the dispensary, and then must again wait many hours for the physician; as a rule, there are no proliminary appointments with doctors without first an assignment to a treating doctor. All treating doctors of a dispensary have officially-fixed motas of patients they must receive, and normally, because of the pressure of the number of patients needing care, these fixed quotas are "surpassed". Many hours ar still wasted before a patient may see a doctor. T is everloading of dispensaries can be explained in the following manner:
 - (a) There is a real shortage of dispensaries and doctors in comparison with the number of patients needing medical attention;
 - (b) Dispensaries are required to issue and to control sick leaves.

Severe laws regulating sick leaves, their control and the procedure of legalizating sick leaves are in existence in the USSR. These same laws also determine the responsibility of edical personnel for any violations. The so-called "bolnichniy list" (sick leave document) is the only document which legally certifies a sick leave. These documents are legal only if issued by physicians authorized to do so; consequently, under conditions of forced labor, with a very light note of illness requiring temperary release from work, this obligation consumes considerable time, a sit ation which requires most of the time of the majority of the physicians. Also due to this system, an enormous amount of otherwise productive time is totally masted by the patients, which, under conditions existing in other countries is spent in rest and useful labor.

- 5. Private doctors are almost unknown in the USSR. In order to supress private initiative on the part of doctors, the Seviet Government has made it obligatory for doctors to work at state public health establishments and has established extremely high rates of caxation on private practice, as well as numerous other measures.
- 6. Apart from municipal, regional and plant dispensaries and hospitals: private dispensaries and hospitals requiring fees do exist, however, chiefly in the large cities. In comparison with the state public health institutions, however, this system services many times less the number of patients; in overall figures, that is, taking into consideration the whole country rather than the cities alone, the number served by the private institutions is insignificantly small. Service in the private medical establishments is far superior to the public health establishments, not only because there is a fee but also because it is usually a very high fee. I believe that dispensaries requiring payment have
- 7. In summary, the USSR public health system suffers from insufficient capacity and equipment in the hospitals, especially in the hospitals in the province, and from lack of modern equipment. Illustrative of this is the case of amputees, of which there were many in the USSR during World war II and after. Judging from their appearances and from what was said by the amputees themselves and their relatives, they sought prostheses for arms or legs for years before getting them, and when they did get them, they were of such unsatisfactory quality to often
